Entity Relationship Diagrams Change Summary

Product Name Change

Starting in September 2019, the new name for QAD's complete portfolio of products is QAD Adaptive Applications. Additionally, QAD Adaptive ERP is the new name for QAD's flagship ERP solution. QAD Adaptive ERP includes the functionality previously associated with QAD Cloud ERP and QAD Enterprise Applications - Enterprise Edition, plus the QAD Enterprise Platform and Adaptive UX which resulted from the Channel Islands program. Going forward, the terms QAD Enterprise Applications, QAD Cloud ERP, and Channel Islands will be deprecated but will remain in previous documentation and training materials. QAD's intention is to—as soon as possible—eliminate the use of the deprecated terms going forward.

Change Summary

The following table summarizes significant differences between this document and previous versions.

Date/Version	Description	Reference
September 2020/v2020 EE	Rebranded for 2020 EE	--
September 2019/QAD 2019EE	Added Production Order entity diagrams to Section 1.	page 86 through page 91
	Added new Purchasing Requisition diagram to Section 1.	page 95
March 2019/v2018 EE Revision 2	Added new Section 3 for additional products.	
	Moved Data Collection 3.1 Event Template to new Section 3	page 378
	Moved Data Collection 3.1 Lookup Template to new Section 3	page 379
	Moved Data Collection 3.1 Program Definition to new Section 3	page 380
	Moved Data Collection 3.1 Service Connection to new Section 3	page 381
	Moved Data Collection 3.1 Transaction Definition to new Section 3	page 382
	Moved Data Collection 3.1 Transaction Menu to new Section 3	page 383
	Added Label Printing Service 3.1 Application Configuration	page 384
	Added Label Printing Service 3.1 Auto Release Startup	page 385
	Added Label Printing Service 3.1 Label Content Routing	page 386
	Added Label Printing Service 3.1 Label Extract Configuration	page 387
	Added Label Printing Service 3.1 Label Format	page 388
	Added Label Printing Service 3.1 Label Maintenance	page 389
	Added Label Printing Service 3.1 Label Manual Release	page 390

Diagram Conventions

This chapter explains the diagram conventions used in this volume.

Introduction **2**

How to Use the Diagrams **3**

Introduction

This guide details major relationships between tables in a QAD Enterprise Edition database. These diagrams are designed to help:

- Programmers interested in customizing or modifying the standard system. The diagrams show relationships that must be preserved in any customization or modification.
- Programmers writing queries or custom reports. The diagrams show which tables can be joined and the field specifications required to make them join. Note that all possible table relationships are not shown, just the major ones.
- Administrators interested in the availability of custom reports. The diagrams show which reports you can prepare.
- Users of Progress Results who want to determine the relationships available for reporting.

These diagrams are meant to be used in conjunction with *QAD Database Definitions Technical Reference*, which is available separately.

Entity Relationship Diagrams

In a relational database, each table is a self-contained collection of data about a single thing (or *entity*). There are five relationship line identifiers that can be combined to distinguish 15 specific entity relationships.

The five relationship lines are displayed in Figure 1.1

Fig. 1.1
Table Relationship Description

Relationships are identified by using the lines, as shown in Figure 1.2.

Fig. 1.2
Table Relationship Description

A bar symbol (|) indicates an OR relationship when more than one field can be used for joining.

Relationship Examples

Figure 1.3 shows that one customer can have zero or more sales orders and that one sales order has one and only one customer.

Fig. 1.3
cm_mstr to so_mstr Relationship Example

To join these two tables within Progress, you would set so_cust equal to cm_addr or vice versa.

```
FOR EACH cm_mstr EACH so_mstr WHERE so_domain = cm_domain AND cm_addr = so_cust:
    DISPLAY cm_addr so_nbr.
END.
```

Figure 1.4 shows that one EMT sales order can have zero or more sales order details and that one sales order detail has one and only one EMT sales order.

Fig. 1.4
so_mstr to sod_det Relationship Example

To join these two tables within Progress, set so_nbr to sod_nbr.

```
FOR EACH so_mstr EACH sod_det WHERE so_domain = sod_domain AND so_nbr = sod_nbr:
    DISPLAY so_nbr and sod_nbr.
END.
```

How to Use the Diagrams

The diagrams are organized alphabetically by functional modules. The most practical way to find information about a particular area is to turn to the diagram for that area. Find the entity (table) that you are interested in and trace out the relationships.

Not all relationships are shown in any one diagram; if you are interested in the other relationships, use the cross-reference table to find the other diagrams the tables appear in “Entity Cross-Reference” on page 178.

When creating a report or browse, use the entity relationship diagrams to decide which table names you should use (and the join relationships). If no relationship exists between two tables, a report showing such a relationship is not possible.

For Progress Results users, these diagrams indicate the relationships that you can show. Progress Results shows the names of tables that have relationships with a specified table. These diagrams show those tables in graphic form and show the subsidiary relationships between tables.

Operational Tables

QAD table names and table name description are closely related. The table name consists of a prefix and type, separated by an underscore (_). Common table types are listed in Table 1.1.

Table 1.1
Database Table Types

Table Type	Meaning	Description
ctrl	Control	Parameters and logical fields that control other functions.
mstr	Master Table	Used for data storage.
det	Detail Table	Detail related to another record. There are typically many detail records associated with one master record.

4 QAD Entity Diagrams Technical Reference

Table Type	Meaning	Description
hist	History Table	Contains records created by activity within the database.
plan	Planning Table	Data for planning functions.
wkfl	Work Table	Used to support other functions.

In the typical case, the table prefix consists of two or three significant letters of the table name description.

Example The table name for sales order master is so_mstr, and po_mstr is the table name for purchase order master.

In most cases, the first letter of the table name is the first letter of the description; the few exceptions involve tables such as line changeover master, which is chg_mstr.

Detail tables related to master data typically have the same prefix with the addition of the letter d.

Example The detail table associated with so_mstr is sod_det.

Within a table, all the data elements use the same prefix.

Example The repetitive production schedule (rps_mstr) table includes fields named rps_part and rps_record.

Financial Tables

Financial table relationships differ slightly from operational table relationships. In financial entity diagrams:

- The key to most relationships between financial tables is an ID field. In most cases, the ID field is the same for both tables. When they are the same, the ID field is not included in the financial entity diagrams. When the ID field is not the same, it is included; see Figure 1.5 on page 5.
- Some relationships show multiple arrows. This indicates that multiple fields are linked between the tables. For example, the Year End Close diagram has four arrows between the YearClosing and GL tables. This is because the YearClosing table contains four fields that are GL accounts and point to the GL Account table; see “Year End Close” on page 341.
- Some diagrams depict Q-variant tables that hold temporary data. The dotted-line tables have names that start with the letter Q; for example, QPostingLine. Typically, the records in the Q tables are created when certain actions or transactions occur, then the system transfers the data to other permanent tables and deletes the data in the temporary Q tables.
- Some diagrams include a line without arrows that indicates an indirect relationship for retrieving the domain code for certain types of data. This occurs when financial data that is specific to a shared set is also stored in operational tables that are domain specific. For example, data stored in the journal table is based on shared sets. Data in the corresponding operational daybook table (dy_mstr) is based on domains. To determine the applicable domain for a particular daybook, the system references the information stored in the DomainSharedSet table. See “Daybook” on page 267.

Fig. 1.5
Financial Diagrams Differences, ID Fields

Replicated Tables

To improve system performance and provide efficiency for data retrieval, some data is stored in duplicate tables in the database. In these cases, the data is created and maintained in one primary table and then copied to a secondary table for use by other functions in the system. When a diagram references a secondary table, the secondary table appears with a shaded background to indicate that it stores data that is actively maintained in a different table.

Most of these replicated tables contain data that is maintained in Financial modules.

Operational Table Relationships

This section includes entity diagrams and cross-reference information for operational modules.

Operational Entity Diagrams **9**

Table/Diagram Cross-Reference (Operational) **177**

Operational Entity Diagrams

The entity diagrams are in alphabetical order starting on the next page.

Table 3.1 on page 178 lists each table included in the diagrams and indicates the title of the diagram where the table appears.

Addresses

Section 2

Financial Table Relationships

This section includes entity diagrams and cross-reference information for Financial functions.

Financial Entity Diagrams **213**

Table/Diagram Cross-Reference (Financial) **343**

Financial Entity Diagrams

The entity diagrams are in alphabetical order starting on the next page.

Table 5.1 on page 344 lists each table included in the diagrams and indicates the title of the diagram where the table appears.

1099

Zero or One $\leftarrow \bigcirc \rightarrow$ One and Only One
 Zero or One $\leftarrow \bigcirc \rightarrow \bigcirc$ Zero or One
 Zero or One $\leftarrow \bigcirc \rightarrow \bigcirc \rightarrow$ Zero, One, or Multiple

Accounts Payable Matching Detail I

Notes: The matching tables hold references to different posting lines that are created.

APMatching holds a single reference to the posting line on the site account.

APMatchingLn holds references to the following posting lines:

- Rate variance
- Usage variance
- Exchange rate variance
- Receipt
- New accrual
- Reversal of previous accrual

APMatchingLnTax holds references to the following posting lines:

- Non-revocable tax
- Purchase price variance
- Normal tax
- Retained tax

APMatchingLnRevTax holds a single reference for every posting line that reverses the tax impact of the matched pending voucher.

Budget Flow

Budget History

Note: BudgetLink contains the sum of all actuals that point to a certain combination of a Budget, BudgetWBS, and BudgetPeriod.

Note: Table QBudgetLinkActual is a table that holds records that are created for every posting line that is created, deleted, or modified (if the budgeting has been turned on for the system and the GL is enabled for budgeting). The budget daemon will delete the QBudgetLinkActual record and will optionally create multiple BudgetLinkActual records for it.

Note: BudgetLinkActual also contains the GL, Division, Project, CostCentre, and all SAF details of the original posting, but this information is not stored as real table relations. This information is kept by storing the code-fields and not the ID fields. Every posting line that had impacted the data in BudgetLink will also be reflected by a record in BudgetLinkActual.

Posting III

Posting History

Notes: Every QPostingLine is directly linked to a PostingLine and every QPostingSaf is directly linked to a PostingLine although there is no physical relation between the normal tables and the q-variants (to avoid performance overhead).

The q-records are created when a posting is created, changed, or modified and is picked up by the history daemon.

QPostingLine and QPostingSaf are created when the posting is created and hold all links to the analytical tables.

The history daemon processes the records that the system deletes once the system adds them to PosthiHist, PostingSafHist, and PostingSafCombined.

Table/Diagram Cross-Reference (Financial)

This chapter provides a cross-reference of Financial tables and the diagrams in which they appear.

***Financial Cross-Reference* 344**

Financial Cross-Reference

Table 5.1 lists each database table referenced by Financial modules in alphabetical order and indicates the diagrams where the table appears.

Section 3

Add-ons Table Relationships

This section includes entity diagrams and cross-reference information for Financial functions.

Add-ons Entity Diagrams 377

Table/Diagram Cross-Reference (Add-ons) 399

Add-ons Entity Diagrams

The entity diagrams are in alphabetical order by product name starting on the next page.

Table 7.1 on page 400 lists each table included in the diagrams and indicates the title of the diagram where the table appears.

Table/Diagram Cross-Reference (Add-ons)

This chapter provides a cross-reference of operational tables and the diagrams in which they appear.

Entity Cross-Reference 400

Entity Cross-Reference

Table 7.1 lists database tables in alphabetical order and indicates the diagrams where the tables appear.
